

Tone systems of Dinka dialects

Bert Remijsen (University of Edinburgh)

Arts & Humanities
Research Council

BEYOND TEXT

Goals of my research on Dinka tone

- Investigate the parameters of divergence between dialects of Dinka, in terms of:
 - inventory
 - realisation
 - contextual processes
- Consider the relevance of the findings to theory and typology.

Goals of my research on Dinka tone

- Investigate the parameters of divergence between dialects of Dinka, in terms of:
 - inventory
 - realisation
 - contextual processes
- Consider the relevance of the findings to theory and typology.

Part 1

Part 2

Part 1 / Background

Dinka is:
a Nilo-Saharan
language
spoken in Southern
Sudan
by approx. 2 million
people.

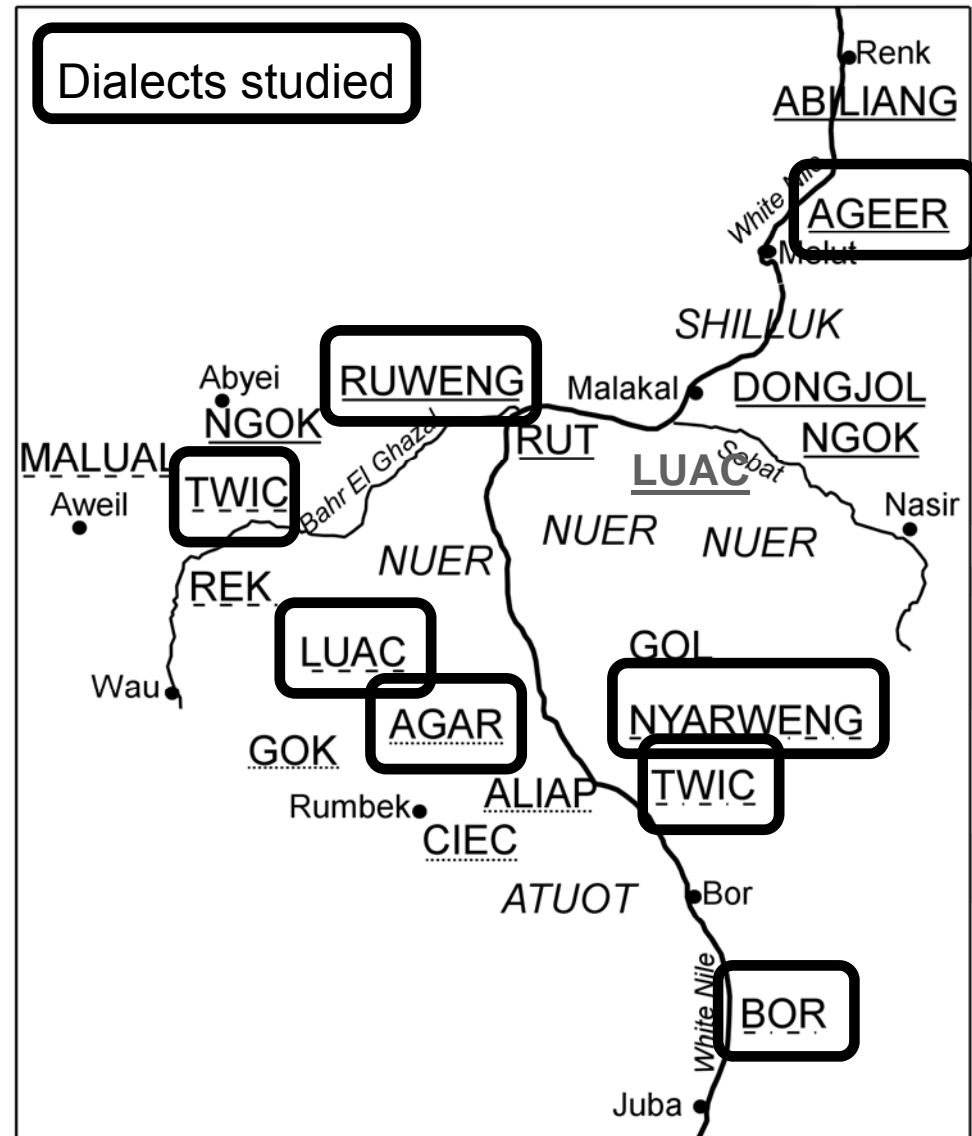

Figure: The Dinka language area, marked on the Nile tributary network.

Part 1 / Methodology

My investigations on tone in Dinka so far:

- 8 dialects studied;
- 3+ speakers per dialect;
- tonemes in various word patterns and sentence contexts;
- phonological and phonetic analyses

Part 1 / Vowels, voice quality, length

- Seven vowel phonemes: /i,e,ɛ,a,ɔ,o,u/
- Two phonemic voice qualities (modal vs. breathy):

ròoor 'forest.SG'

ròoor 'man.PL'

- Three levels of vowel length (V / VV / VVV):

cól 'mouse.SG'

cǒol 'charcoal.SG'

còool 'charcoal.PL'

Part 1 / Inventory of tone

- Most dialects have 4 distinctive tone patterns or tonemes: High (H), Falling (HL), Low (L), Rising (LH).

Part 1 / Inventory of tone

- Most dialects have 4 distinctive tone patterns or tonemes: High (H), Falling (HL), Low (L), Rising (LH).
- E.g. Luanyjang (Luac) – Remijsen & Ladd (2008):

H	HL	L	LH
bạ̣n chief.SG	gệem cheek.SG	jụ̀r stranger.SG	cọ̣ok foot.SG
lẹ́eŋ drum.SG	t̄iim tree.PL	nọ̀oon grass.SG	p̄aal knife.SG

Part 2 / Dispersion Theory

- Main difference in realisation among the 4-toneme dialects: relative height of the LH:

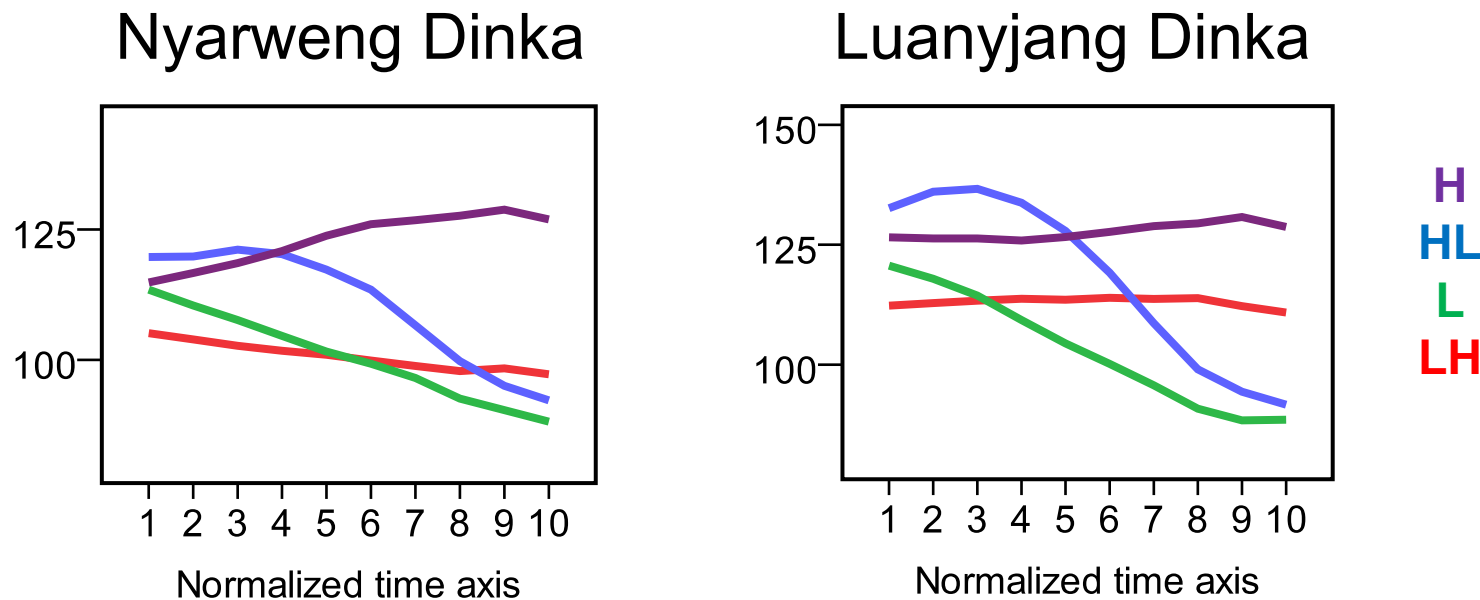

Figure: Averaged f0 traces of the tonemes in Nyarweng and Luanyjang, on the voiced part of the rhyme. Each trace represents 2 or 3 lexical items by 3 speakers in isolation.

Part 1 / Word structure

- The great majority of Dinka words consists of closed monosyllables, e.g.:

bîŋ

cup.SG

mjèɛɛr

giraffe.PL

- Native polysyllabic words invariably begin with /a-/, and end in a closed syllable, e.g.:

aŋáaar

buffalo.SG

adòok

gourd.PL

- Only the final syllable carries tone phonologically.

Part 1 / Tonal crowding

Tonal crowding

- Contour tones \implies >1 tone target per TBU;

- TBU = σ

- 1-syllable words

- V vs. VV vs. VVV

Limited amount of segmental material for tonal realisation (cf. Xu 2004)

Part 1 / Tonal crowding

Phonological 'solution' to tonal crowding:

- In some dialects, tone sandhi reduces the number of tone targets in particular contexts.

Bor Dinka:

- HL → H becomes in all non-final contexts.

- Rule – HL simplification:

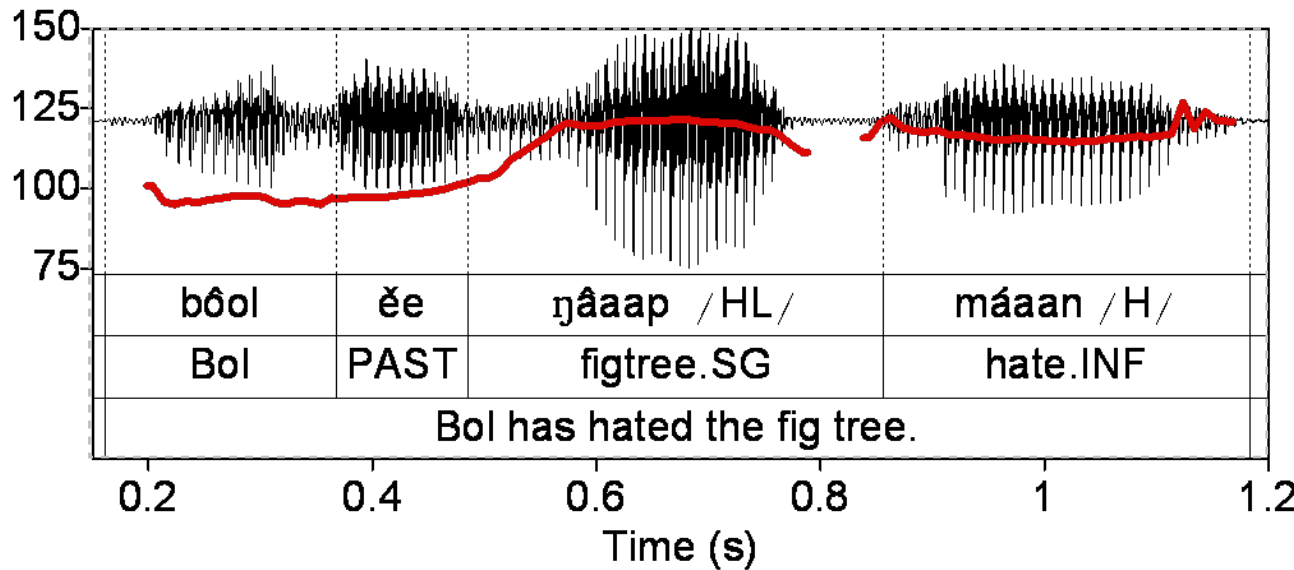

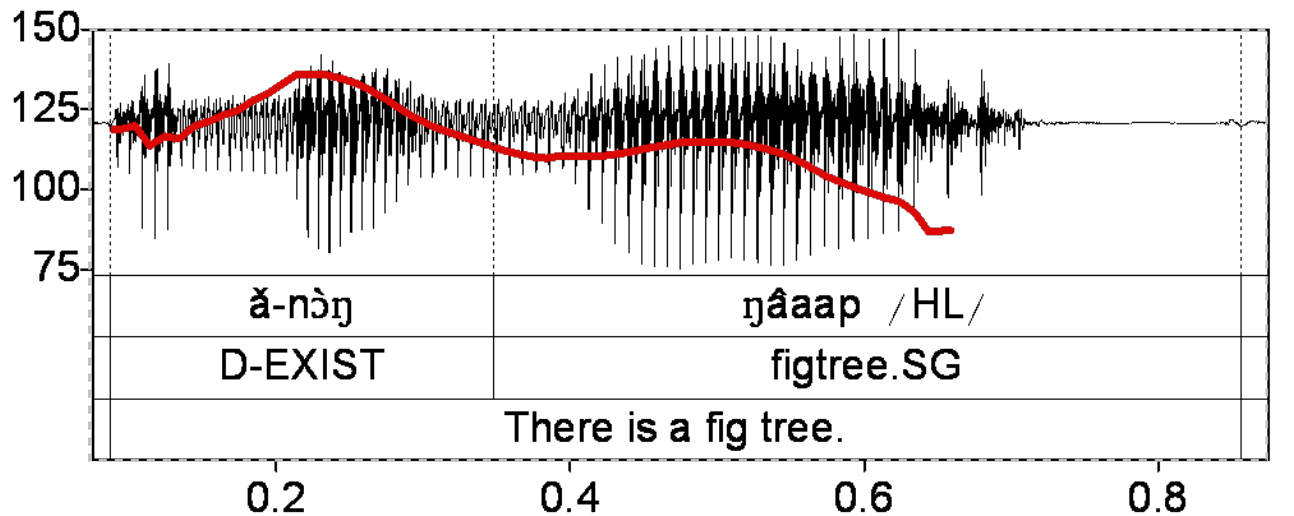

Figure: An illustration of HL Simplification in the Bor dialect of Dinka.

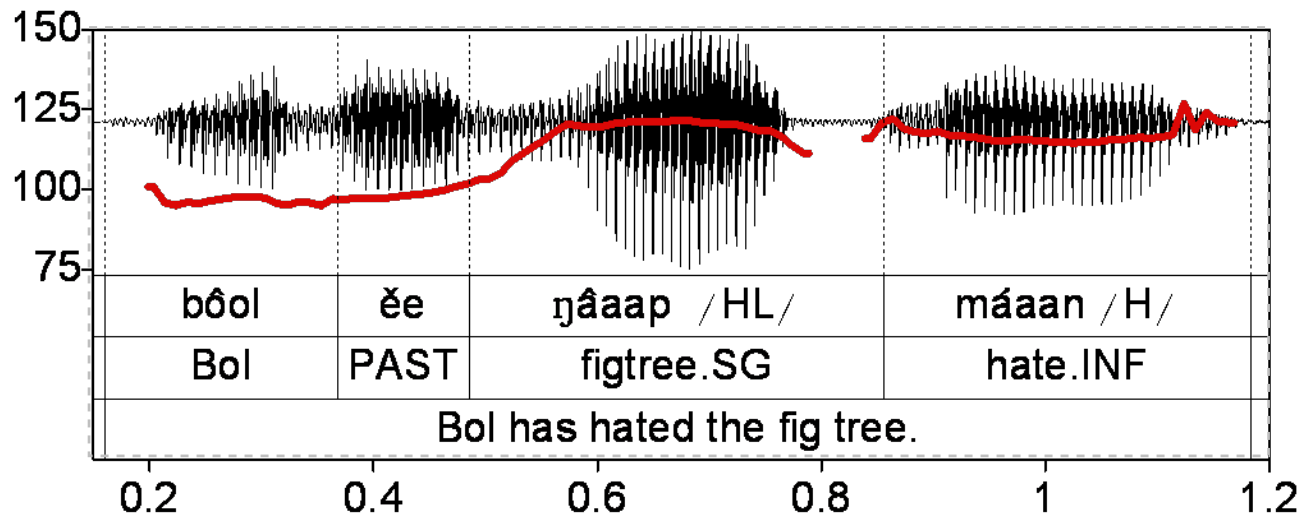

Part 1 / Tonal crowding

Phonetic ‘solution’ to tonal crowding:

- Nyarweng Dinka: no phonological mechanisms; just articulatory undershoot when segmental material is limited.

Bor Dinka:

ŋâap
figtree.SG

Nyarweng
Dinka:

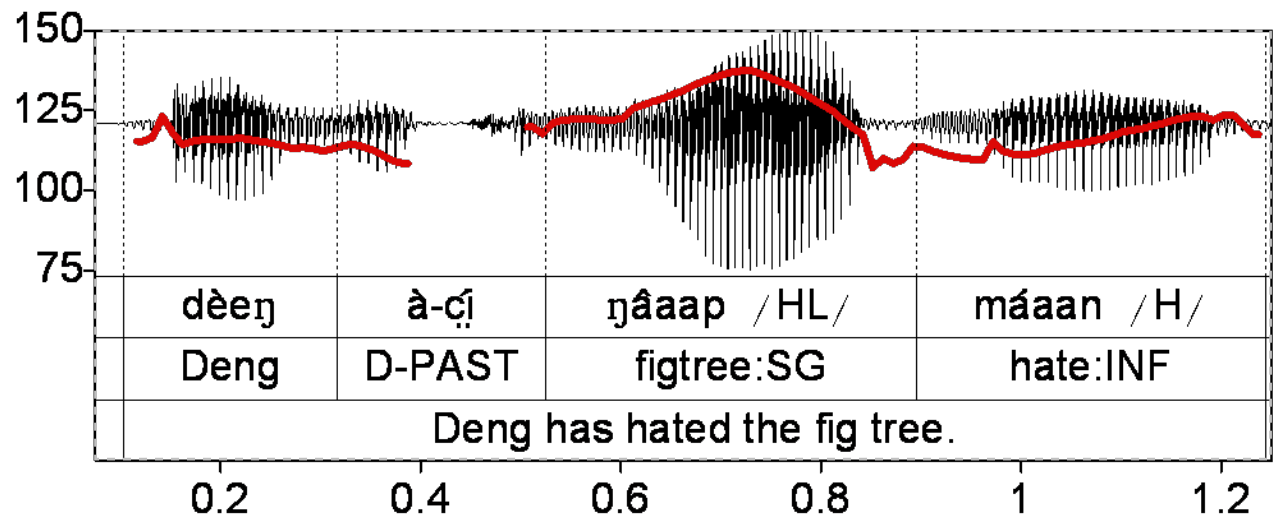

Figure: Illustration of HL Simplification in Bor vs. its absence in Nyarweng.

Nyarweng:
HL on CVVVC

Nyarweng:
HL on CVC

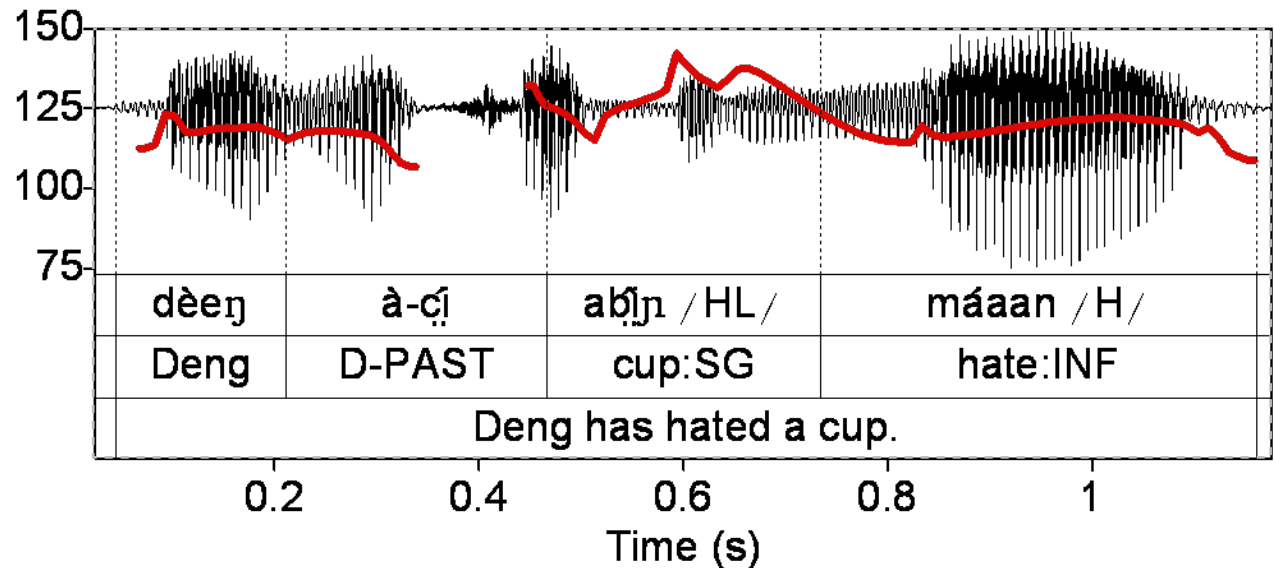

Figure: The effect of vowel length on the phonetic realisation of the HL contour tone in Nyarweng.

Part 1 / Tone sandhi

- Another dialect, Luanyjang, gets rid of HL contours by means of a different phonological process: Dissimilatory Lowering.
- This process sheds light on the nature of the contour tones.

Part 1 / Tone sandhi

<p>H L H > H L H</p> <p>nòoon 'grass.SG'</p>	<p>Acôol à-<u>cí</u> nòoon máaan</p> <p>Achol D-PAST grass.SG hate.INF</p> <p>'Achol hated grass.'</p>
<p>H H H > H L L</p> <p>aṇáaar 'buffalo.SG'</p>	<p>Acôol à-<u>cí</u> aṇáaar máaan</p> <p>Achol D-PAST buffalo.SG hate.INF</p> <p>'Achol hated a buffalo.'</p>

Part 1 / Tone sandhi

<p>H L H > H L H</p> <p>nòoon 'grass.SG'</p>	<p>Acôol à-<u>cí</u> nòoon máaan</p> <p>Achol D-PAST grass.SG hate.INF</p> <p>'Achol hated grass.'</p>
<p>H H H > H L L</p> <p>aṇáaar 'buffalo.SG'</p>	<p>Acôol à-<u>cí</u> aṇáaar máaan</p> <p>Achol D-PAST buffalo.SG hate.INF</p> <p>'Achol hated a buffalo.'</p>
<p>H HL H > H L H</p> <p>tîim 'tree.PL'</p>	<p>Acôol à-<u>cí</u> tîim máaan</p> <p>Achol D-PAST tree.PL hate.INF</p> <p>'Achol hated trees.'</p>
<p>H LH H > H LH L</p> <p>păal 'knife.SG'</p>	<p>Acôol à-<u>cí</u> păal máaan</p> <p>Achol D-PAST knife.SG hate.INF</p> <p>'Achol hated a knife.'</p>

Part 2 / Tone sandhi

- Summary of Dissimilatory Lowering in Luanyjang:

Underlying	Observed
H L H	H L H
H H H	H L L
H HL H	H L H
H LH H	H LH L

Part 2 / Tone sandhi

- Summary of Dissimilatory Lowering in Luanyjang:

Underlying	Observed
H L H	H L H
H H H	H L L
H HL H	H L H
H LH H	H LH L

- Rule:

Part 1 / Conclusions

- Four tonemes: High, Low, Rise (LH), Fall (HL);
- No interaction with three-level vowel length at the level of the inventory: the TBU is the syllable;
- Most but not all dialects have sandhi rules that reduce tonal crowding.

Part 2: Tone in Dinka dialects from the perspective of Dispersion Theory

Part 2 / Introduction

- Dispersion Theory (Liljencrants & Lindblom 1972, Becker-Kristal 2010):
 - vowel categories are good to the extent that they are perceptually distinct from one another;
 - vowel categories are adaptive: they maximise perceptual distance.

Part 2 / Dispersion Theory in vowel systems

- Dispersion Theory is well-supported for vowel systems. Illustration from Becker-Kristal (2010):

Five-vowel systems

Figure: descriptive stats on F1x F2 values in 5-vowel systems (41 languages).

Part 2 / Dispersion Theory in vowel systems

- Dispersion Theory is well-supported for vowel systems. Illustration from Becker-Kristal (2010):

Five-vowel systems

Seven-vowel systems

Figure: descriptive stats on F1x F_2 values in 5-vowel systems (41 languages) vs. 7-vowel systems (32 languages).

Part 2 / Dispersion Theory in tone systems

- The detailed phonetic realisation of vowel categories has implications for their phonological representation.
- My argument: Dispersion Theory can also benefit the study of tone – it can inform the evaluation of competing analyses.

Part 2 / Dispersion Theory in tone systems

- Consider the realisation of the Fall toneme (full line) in three dialects of Ma'ya (Remijsen 2001):

Laganyan dialect

Salawati dialect

Misol dialect

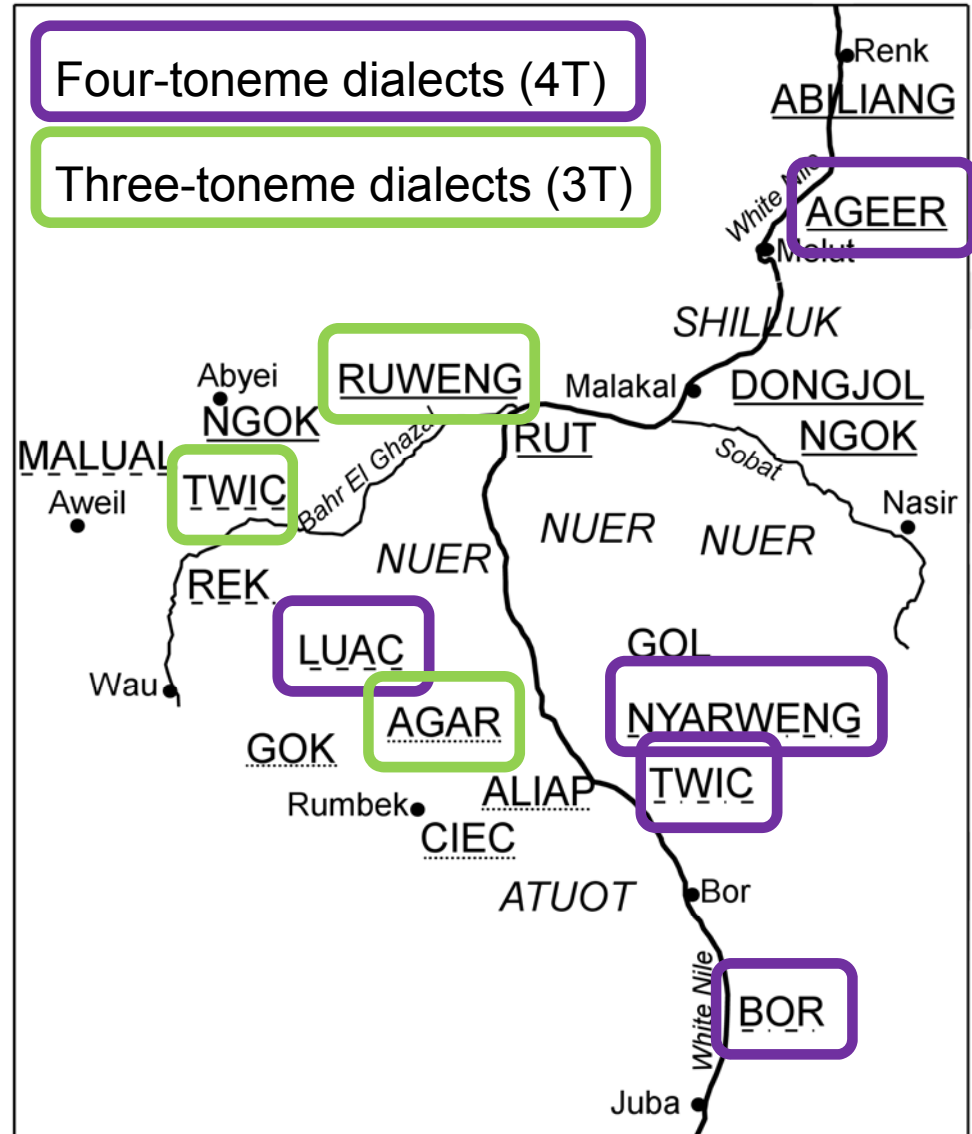

Figure: Averaged F0 traces (8 spks/dialect) of the 3 tonemes of Ma'ya in utterance-final context, in 3 dialects.

Part 2 / Three- vs. four toneme systems

- Three dialects of Dinka have only 3 tonemes:
 - Western Twic
 - Ruweng
 - Agar (Andersen 1987)

Part 2 / Twic (3T)

- H (purple) vs. LH (red) is neutralised in Twic (3T): its H toneme is at the top end of the tonal space.

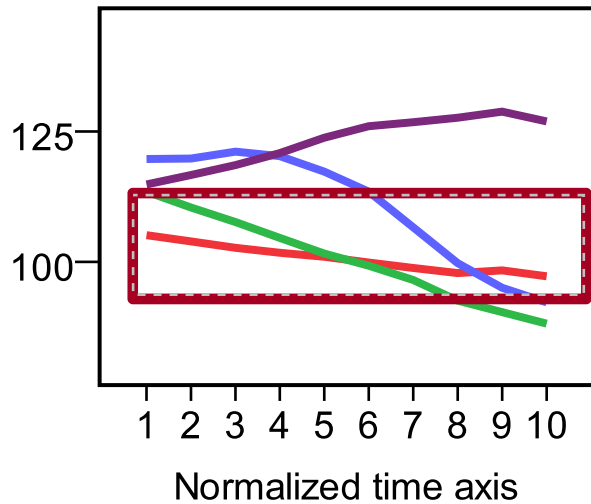

Figure: Averaged f0 traces of the tonemes of the Nyarweng, Luanyjang and Twic. Each trace represents 2 or 3 lexical items by 3 speakers in isolation.

Part 2 / Twic

- Sound example – pǎal ‘knife.SG’ by 2 speakers of each of these three dialects:

Nyarweng (4T)

Luanyjang (4T)

Twic (3T)

Part 2 / Agar and Ruweng

- In Ruweng (3T) and Agar (3T), however, the 'High' is not at the top. Contrary to Dispersion Theory.

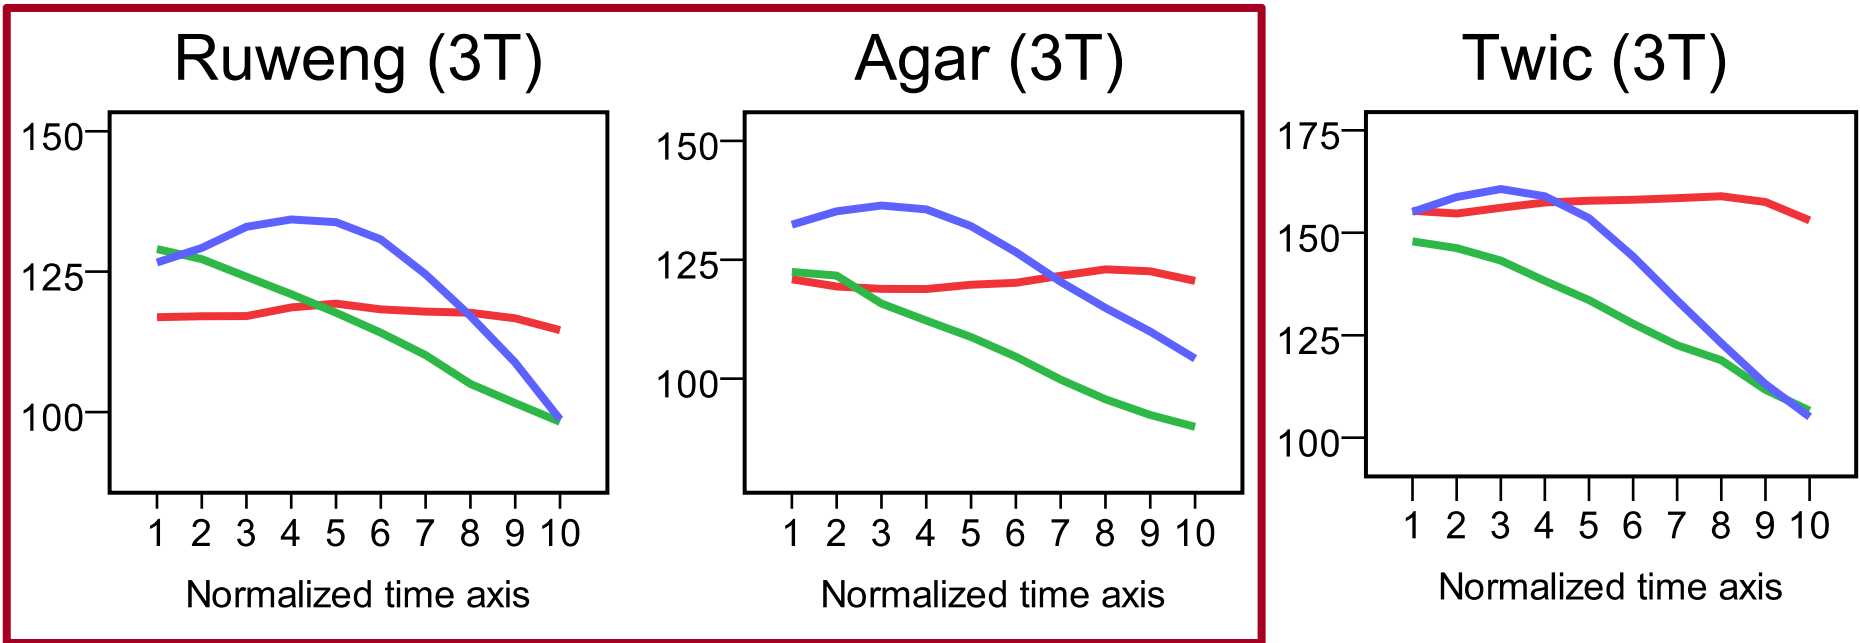

Figure: Averaged f0 traces of the tonemes of Ruweng, Agar and Twic. Each trace represents 2 or 3 lexical items by 3 speakers in isolation.

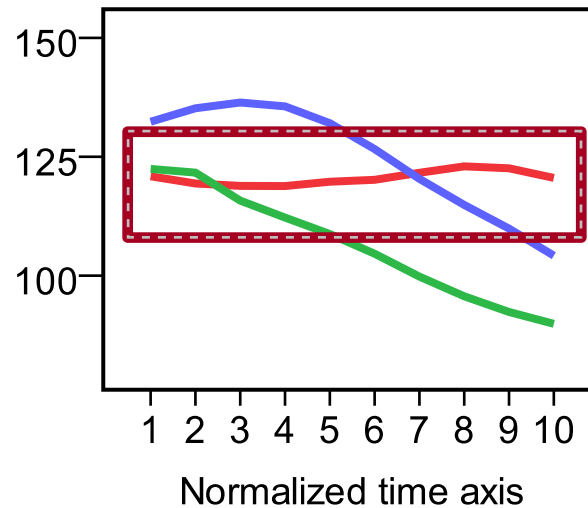

Part 2 / Agar and Ruweng

- Sound example – pǎal ‘knife.SG’ by 2 speakers of each of these three dialects:

Ruweng (3T)

Agar (3T)

Twic (3T)

Part 2 / Agar and Ruweng

- In Ruweng (3T) and Agar (3T), *H and *HL have neutralised: both are falling in final position and high elsewhere.
- Example – a *H infinitive verb:

Nyarweng (4T)	Dèeŋ à-ɕí nòoon máaan Deng D-PAST grass.SG hate.INF 'Deng hated grass.'
Ruweng (3T)	Dèeŋ à-ɕí nòoon mâaan Deng D-PAST grass.SG hate.INF 'Deng hated grass.'

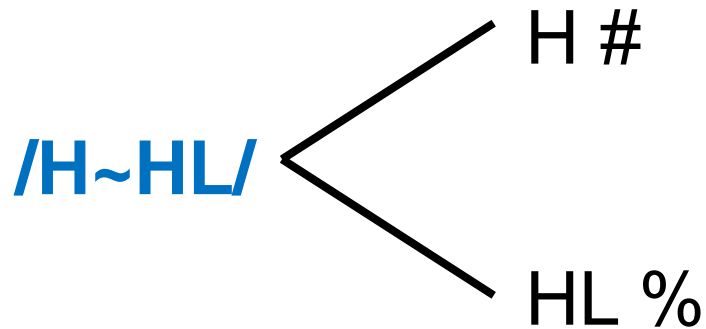

Part 2 / Agar and Ruweng

- In Ruweng (3T) and Agar (3T), *H and *HL have neutralised.

	*L	*LH	*H	*HL
4-toneme dialects	•	•	•	•
Agar, Ruweng	•	•	•	

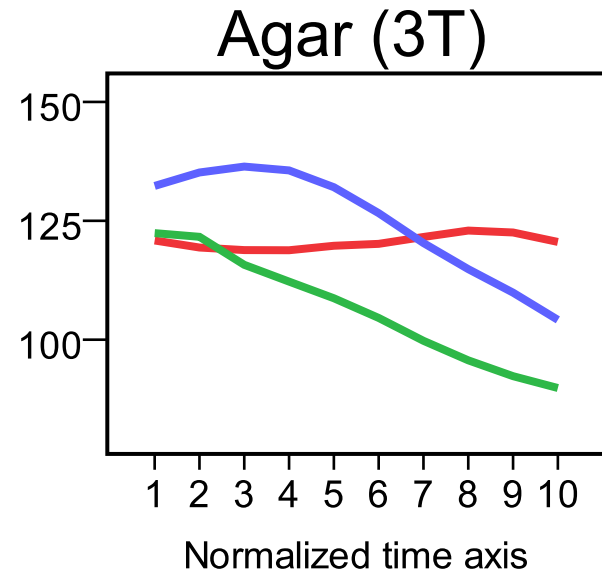

Part 2 / Agar and Ruweng

- What is the most appropriate phonological representation of the toneme?

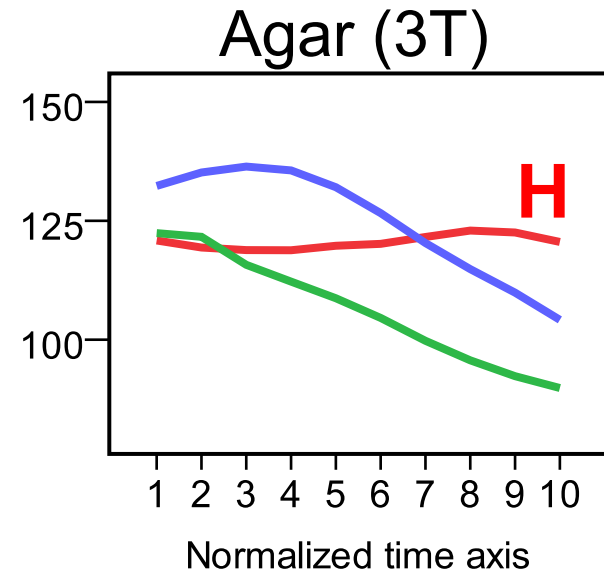

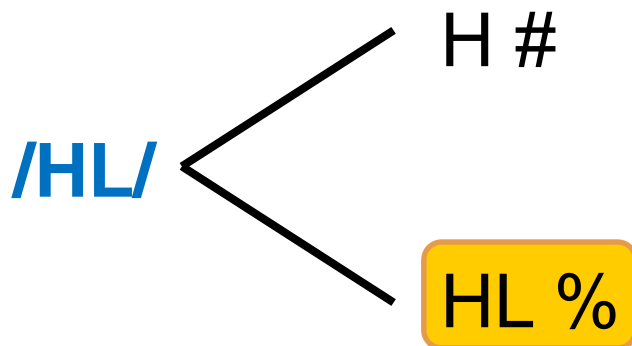

Part 2 / Agar and Ruweng

- What is the most appropriate phonological representation of the toneme?
- Andersen (1987) on Agar:

Part 2 / Agar and Ruweng

- What is the most appropriate phonological representation of the toneme?
- Andersen (1987) on Agar:

Contrary to Dispersion Theory: the 'H' (red line) does not shift upwards to maximise perceptual distance

Part 2 / Agar and Ruweng

- What is the most appropriate underlying representation?
- Reanalysis proposed here:

Part 2 / Agar and Ruweng

- What is the most appropriate underlying representation?
- Reanalysis proposed here:

In line with Dispersion Theory: the H (blue line) is at the top of the tonal space

Part 2 / Agar and Ruweng

- There is additional support for the reanalysis from Dissimilatory Lowering in the Ruweng dialect – remember Luanyjang:

Part 2 / Agar and Ruweng

- Dissimilatory Lowering in Luanyjang (4T):

<p>H L H > H L H</p> <p>nòoon 'grass.SG'</p>	<p>Acôol à-cí nòoon máaan</p> <p>Achol D-PAST grass.SG hate.INF</p> <p>'Achol hated grass.'</p>
<p>H H H > H L L</p> <p>aṇáaar 'buffalo.SG'</p>	<p>Acôol à-cí aṇáaar máaan</p> <p>Achol D-PAST buffalo.SG hate.INF</p> <p>'Achol hated a buffalo.'</p>
<p>H L H H > H L H L</p> <p>pǎal 'knife.SG'</p>	<p>Acôol à-cí pǎal máaan</p> <p>Achol D-PAST knife.SG hate.INF</p> <p>'Achol hated a knife.'</p>

Part 2 / Agar and Ruweng

- Summary of Dissimilatory Lowering in Luanyjang Dinka (4T):

Underlying	Observed
H L H	H L H
H H H	H L L
H L H H	H L H L
H H L H	H L H

- Rule:

Part 2 / Agar and Ruweng

- Dissimilatory Lowering in Ruweng Dinka (3T) – transcription following Andersen (1987) on Agar:

H L HL > H L HL nòoon 'grass'	Acôol à- <u>ç</u> í nòoon mâaan Achol D-PAST grass.SG hate.INF 'Achol hated grass.'
H HL HL > H L L aɲâaar 'buffalo.SG'	Acôol à- <u>ç</u> í aɲâaar mâaan Achol D-PAST buffalo.SG hate.INF 'Achol hated a buffalo.'
H H HL > H LH L páal 'knife.SG'	Acôol à- <u>ç</u> í páal mâaan Achol D-PAST knife.SG hate.INF 'Achol hated a knife.'

Part 2 / Agar and Ruweng

- Summary of Dissimilatory Lowering in the Ruweng dialect (3T):

Application of Andersen (1987) to Ruweng		This reanalysis:		
Underlying	Observed	Underlying	Observed	
H HL HL	H L L	H H H	H L L	
H H HL	H H L	H LH H	H L H L	

Part 2 / Agar and Ruweng

- The reanalysis proposed here allows for a better generalisation of Dissimilatory Lowering in Ruweng.
- Rule – same as in Luanyjang (4T):

Part 2 / Agar and Ruweng

- Three lines of evidence support the same analysis, i.e., that H underlies H~HL in Ruweng:
 - Dispersion Theory
 - cognates from 4T dialects
 - Dissimilatory Lowering
- They suggest that the surface realisation found in citation and sentence-finally (HL) is not the phonological representation.

Part 2 / Agar and Ruweng

- In Agar, the other 3T dialect, however, there is no Dissimilatory Lowering, and Andersen (1987) is solely based on data from this dialect.
- Here the positioning of the tonemes in the tonal space provides the only dialect-internal argument for the interpretation that the underlying representation of /HL~H/ is H, rather than HL.

Part 2 / Conclusion

- The phonetic realisation of tonal categories reflects their phonological nature, just as is the case for vowels;
- The predictions of Dispersion Theory re. the phonetic realisation of sound categories can contribute to the phonological analysis of tone systems.

Part 1 / The grammatical function of tone

- Like the other suprasegmental distinctions, tone is heavily involved in the morphosyntax – e.g.:

adwòk ǎ-mèl
gourd.SG AGR-soil.2SG
You make the gourd dirty.

adwòk ǎ-mêl
gourd.SG AGR-soil.PASS
The gourd is being made dirty.
